PROCEDURE TO OPEN RANDOM NUMBER ON ANY LOCK OTHER THAN THE ITALY OR PRESTO LOCKS

Tool needed* Any very thin piece of metal that will not bend and can fit into the gap between the numeric tumblers and the brass top plates. Make sure that the tool has a sharp edge to feel the dip properly.

PROCEDURE:

Run the tool between the numeric tumbler and the brass top plate. If the number is correct, it will have a little dip in the inner spindle. If not, the spindle should be smooth. On each side, do this to all three numeric tumblers on the side nearest the release button.

SEE EXAMPLE BELOW

PROCEDURE FOR OPENING RANDOM NUMBER ON THE ITALY LOCK

Using the same tool, the procedure is very similar to that of the lock above. However the difference is that the groove is on the side further from the release button. Also when finding the groove on the second tumbler, you are actually looking for the correct number for the 1st tumbler. So if on the 1st tumbler the correct number is "2" then the second tumbler should have a dip or groove. The same is done on the second while the groove is found on the 3rd tumbler's spindle. Now you have two numbers. The last you find by guessing or trying each number on the 3rd tumbler. For example, if you find that the correct combination for the first two tumblers are 2 2 , then simple try 0-9 for the third tumbler until you can open it.

EXAMPLE: This combination would be 2 2 2.
